Allocation scheme (WEEE/BAT)

DPA-System is short for Danish Producer Responsibility System. DPA-System is in charge of administrative tasks associated with the rules on producer responsibility under Danish environmental law regarding waste from electrical and electronic equipment, end-of-life batteries and accumulators, and end-of-life vehicles.

Producer responsibility for these waste types has authority in the Danish Environmental Protection Act. This Act translates into three Statutory Orders for the different waste types: the WEEE Order, the Battery Order, and the End-of-life Vehicles Order (the current statutory texts can be found on www.dpa-system.dk).

The Danish Statutory Orders take offset in three EU directives for the same waste types: the so-called WEEE Directive, the Batteries Directive, and the ELV Directive. Also these directives with exact titles and dates can be found on www.dpa-system.dk.

Producer responsibility rests on the principle that each producer or importer assumes responsibility for collection and management of WEEE, waste batteries, and end-of-life vehicles to the effect that products becoming waste are managed in an environmentally correct manner, with the highest possible utilisation of resources contained in such products.

Producers and importers are in the following referred to as *producers* as the rules applying to both types are the same.

In general, the following abbreviations are used: WEEE for waste electrical and electronic equipment, BAT for batteries and accumulators, and ELV for end-of-life vehicles.

In pursuance of the rules on producer responsibility for WEEE, waste batteries and accumulators, and ELV, respectively, this document describes principles and procedures regarding allocation of collection areas from which producers and collective schemes must collect WEEE and portable batteries.

Distribution of WEEE and batteries from households

In pursuance of the above Orders producers of equipment for use in private households and portable batteries shall take back a proportionate share of WEEE and portable batteries from households. The WEEE taken back by the producer must belong to the categories of EEE placed on the market by the company. The producer may affiliate to a collective scheme that assumes responsibility for take-back/collection.

Distribution of WEEE and batteries from households is in the following referred to as the allocation scheme.

WEEE and waste portable batteries are normally collected in the following ways:

Through municipal collection sites

Through collection sites established by the collective schemes

Through collection organised by an individual producer

The allocation scheme only covers allocation of collection duty from the municipal collection sites to individual compliers and collective schemes.

Establishment of municipal collection sites

Municipal collection sites are established by the municipalities and operated by individual municipalities or intermunicipal waste management companies. Collection sites receive WEEE in all categories from households. At the municipal collection sites WEEE categories are separated into six fractions as stipulated in the WEEE Order. The producers/collective schemes pick up WEEE from the collection sites when it has been separated into the six fractions. Batteries are delivered in a separate fraction.

The municipalities register their collection sites and need for collection equipment on the DPA-System website. The municipalities decide the number of collection sites on their territory. Registered collection sites can be found on the DPA-System website.

Producers' and collective schemes' share of waste equipment and batteries

The producers must take back their proportionate share of WEEE from the municipal collection sites. To allow for calculation of producers' share of WEEE the producers report annually to DPA-System quantities of EEE per category placed on the market.

Based on reported data DPA-System calculates the market shares of producers and the collective schemes within the six fractions covering the categories as well as portable batteries.

Allocation principles

The allocation is based on producer market shares per fraction as well as an average of three years' collected quantities per fraction and municipality. When this calculation has been made DPA-System makes a geographic allocation of the different municipalities and associated collection sites to the producers and the collective schemes. Allocation of the different collection sites takes place per fraction since producers' market shares typically vary from fraction to fraction. The result may be that several producers or collective schemes are allocated the same collection site, but with the responsibility for each their fraction.

The below table shows the result of recent discussions with the collective schemes; the following principles and priority were agreed. DPA-System carries out the allocation in which a municipality is the smallest allocation unit:

Table: Revised criteria for allocation principles - revision March 2017

iteria fo	or allocation - priority ranked	Purpose
Inder the below prioritized principles DPA-System allocates the geographic areas in Jenmark from where producers must collect WEEE in the six fractions as well as waste ortable batteries:		Compliance with statutory requirements
1	Market shares	Compliance with statutory
	Allocation is made in relation to market shares, which again are based on quantities placed on the market per fraction. The market share is calculated including adjustments from previous years.	requirements
	Geographic locations	To ensure that the producers
	Regions In relation to his market share, the producer will be allocated with collection of WEEE and batteries in three geographical areas:	are allocated with collection o WEEE all over the country, thu offsetting geographic differences in the WEEE.
3a	Area 1: Capital Region and Region of Sealand. Area 2: Region of North Denmark and Region of Central Denmark. Area 3: Region of Southern Denmark. The producer may be allocated collection in fewer areas if his market share is too small for the allocation to be distributed on allocation units in all three areas.	differences in the WEEL.
	Non-bridged islands Every three years a change in the allocation of non-bridged islands must be made, the change being most important in the following rank of priority:	To ensure that the costs of fer transportation are not allocate to the same producers over a long period.
3b	Bornholm Samsø Ærø Fanø Læsø	
4	Municipalities are grouped in a way that as far as possible they constitute a coherent geographic area.	Optimization of collection logistics.
5	There must be as few collective schemes per municipality as possible. As far as possible, fractions 1 and 2 and fractions 3 and 4, respectively, should be kept together.	To ensure that the municipalit is serviced by as few collective schemes as possible at all recycling centres. Optimization of collection logistics.
6	Smallest allocation unit The smallest allocation unit is a municipality. Allocation is made in a way that ensures as few changes as possible from the preceding allocation period in terms of collective schemes responsible for the different fractions in the areas.	To ensure that the municipalit has as few changes in producers/collective schemes possible. To allow for establishment of stable cooperation.

	If the municipality is part of an intermunicipal waste management company this company is the smallest allocation unit.	To ensure that the municipality/waste
7	It should be noted that some waste management companies are of a size that this criterion has to be entirely disregarded.	management company is serviced by the same collective scheme/-s at all recycling centres.
NOTELL	for this is a location of a state of the sta	

NOTE! In view of optimizing logistics, producers/collective schemes may agree among them within the same fraction to take over/abandon each other's collection sites in the consultation period for the subsequent year's allocation. Such agreements must be notified to DPA-System, and it will be incorporated in the decision on the subsequent year's allocation.

Allocated geographic areas appear from seven maps of Denmark showing the allocation to the collective schemes for each of the six fractions and portable batteries.

For a detailed review of the principles of allocation to the producers, reference is made to the documents on calculation principles for the allocation scheme for WEEE and BAT, respectively.

Establishment of new collection sites in the allocation period

If new collection sites are established in an area in the allocation period the producer or the collective scheme responsible for one or more fractions in the area must collect the same fractions from the new collection sites.

An outline of collection sites with statement of responsible producers can be found on the DPA-System website.

Allocation period

An allocation period runs for one year — from 1 September to 31 August. A producer having been allocated an area must in the entire period collect all WEEE deriving from the allocated fraction/-s in the area.

Publication of allocation

When DPA-System has made the allocation this is notified directly by e-mail to the producer or his collective scheme. The allocation is also published on the DPA-System website under the item Allocated collection sites.

¹In case the municipality has transferred the responsibility and operation of its collection sites to an intermunicipal waste management company.

DPA-System informs the producer of the areas and associated collection sites allocated to him. The producer must then immediately inform the municipality of operators in charge of practical work. Work covers supply of collection equipment and pick-up of WEEE in the different fractions.

covers supply of concedion equipment and place up of Welle in the americal nuclions.

The municipality is also informed of the result of the allocation. This is done by e-mail sent to the addresses

registered with DPA-System by the municipality under the different collection sites.

Post-adjustment

In the post-adjustment a calculation is made of the deviation between the market share of WEEE and/or

batteries allocated to the producer and the actual quantity taken back by the producer.

If a producer has taken back more WEEE than his proportionate share DPA-System deducts the excess quantity in the allocated quantity of the subsequent period. Similarly, a producer having taken back a smaller quantity than his proportionate share will be allocated with the balance in the subsequent

allocation period.

The post-adjustment also applies to new producers registering in the course of an allocation period or registering data retrospectively for previous periods. Also here an adjustment will be made in the

subsequent period.

Note that no post-adjustment is made for incorrect registrations and re-export for periods more than two

years back.
